

This heatmap illustrates the projected weighted cooling energy consumption (TWh) across different age groups (0-4 to 95-99) and heat index ranges (78.975 to 79.175) for the period 2080-2099 under the SSP1-1.9 scenario. The color scale ranges from 0.2 TWh (dark purple) to 4.4 TWh (yellow). The highest consumption is observed in the 60-64 age group, particularly at lower heat indices, reaching values above 4.0 TWh. Consumption generally decreases as the heat index increases and as age increases beyond the 60-64 range.
