

This heatmap illustrates the projected weighted cooling energy consumption (TWh) across different age groups (0-4 to 95-99) under the SSP2-4.5 scenario for the period 2060-2079. The x-axis represents the Heat Index (ranging from 80.5 to 81.2), and the y-axis represents the Age Groups. The color scale indicates the consumption level, ranging from 0.25 TWh (dark purple) to 4.75 TWh (yellow). The highest consumption is observed in the 50-54 age group, peaking around a heat index of 81.0.

This heatmap illustrates the projected weighted cooling energy consumption (TW/h) across different age groups and heat indices for the period 2040-2059, based on the SSP3-7.0 scenario. The y-axis represents age groups from 0-4 to 95-99. The x-axis represents the heat index from 79.2 to 80.8. The color scale ranges from 0.0 (dark blue) to 7.2 (yellow). The consumption is highest for younger age groups (0-4) and decreases as age increases. The consumption also increases with the heat index, with the highest values (yellow) occurring at lower heat indices for younger age groups and at higher heat indices for older age groups.

Heat Index (SSP3-7.0) (2020-2039)

This heatmap illustrates the projected weighted cooling energy consumption (TWh) across different age groups (0-4 to 95-99) under the SSP3-7.0 scenario for the period 2040-2059. The x-axis represents the Heat Index (ranging from 79.2 to 80.8), and the y-axis represents the Age Groups. The color scale indicates the energy consumption, ranging from 0.0 TWh (dark purple) to 7.2 TWh (yellow). The consumption is highest for younger age groups (0-4 to 20-24) and decreases as age increases. The consumption also increases with the Heat Index, particularly for younger age groups.

This heatmap illustrates the projected weighted cooling energy consumption (TWh) across different age groups (0-4 to 95-99) under the SSP5-8.5 scenario for the period 2040-2059. The x-axis represents the Heat Index, ranging from 80.00 to 81.75. The y-axis represents Age Groups. The color scale indicates the weighted cooling energy consumption, ranging from 0.0 TWh (dark blue) to 5.4 TWh (yellow). The highest energy consumption is observed in the 30-34 age group, particularly at lower heat indices, reaching up to 5.4 TWh. Consumption generally decreases as the heat index increases and as age increases, with the lowest consumption (near 0.0 TWh) observed in the 95-99 age group across all heat indices.

This heatmap illustrates the projected weighted cooling energy consumption (TWh) across different age groups and heat indices under the SSP5-8.5 scenario for the period 2080-2099. The y-axis represents age groups from 0-4 to 95-99, and the x-axis represents the heat index from 85.5 to 89.0. The color scale indicates the energy consumption in TWh, ranging from 0.2 (dark blue) to 4.4 (yellow). The highest energy consumption is observed for the 60-64 age group at a heat index of approximately 87.5, reaching nearly 4.4 TWh. Consumption generally decreases as the heat index increases, particularly for older age groups.
